

Eye Wash & Safety Shower Inspections

Our team has been trained by a leading manufacturer of emergency eye wash and safety shower equipment. We are qualified to both inspect and tag your equipment.

Having the equipment is not enough. A scheduled eye wash and safety shower maintenance system should be in place to ensure your workplace remains compliant.

Improper eye wash and safety shower maintenance can lead to infection from dust, stagnant water and contaminants. This creates risk of legal action for breaching regulations.

HOW TO STAY COMPLIANT

A regular inspection routine is part of an eye wash and safety shower maintenance routine. This inspection ensures your equipment has clean, potable water and is functioning correctly.

The following equipment should also be tested as part of the routine eye wash and safety shower inspection:

- Safety showers
- Eyewash equipment
- Eyewash bottles
- Self-contained eye wash equipment

ANNUALLY

Under AS4775-2007, flow rates and equipment must be checked and tagged compliant to mark successful completion of the inspection.

TRAINED EXPERTS

In accordance with Australian Standard AS4775-2007 we will perform inspections and report to you any need for services.

The Akuna Services inspection addresses maintenance, performance, proper use, installation, training of users and relevant test procedures.
